

IN THE CLAIMS:

Please amend the claims as shown below. The claims, as currently pending in the application, read as follows.

1. to 22. (Cancelled).

23. (Currently Amended) A system having an entrance/exit management apparatus for regulating an entrance/exit of a person and a wireless communication terminal for communicating with the entrance/exit management apparatus, wherein:

the entrance/exit management apparatus comprises:

a transceiving device adapted to transmit, by a first wireless communication method, a communication function restriction request to the wireless communication terminal and to receive a response to the communication function restriction request from the wireless communication terminal; and

a gate device adapted to permit an entrance/exit of a person when the transmitting of the communication function restriction request and the receiving of the response by said transceiving device is completed; and

the wireless communication terminal comprises:

a first communication device adapted to communicate with the entrance/exit management apparatus by the first wireless communication method;

a second communication device adapted to communicate by [[the]] a second wireless communication method; and

a restriction device adapted to restrict communication of said second communication device in accordance with the communication function restriction request received from said transceiving device by said first wireless communication method.

24. (Previously Presented) A system having an entrance/exit management apparatus for regulating an entrance/exit of a person and having a server apparatus for managing an entrance/exit of a person, wherein:

the entrance/exit management apparatus comprises:

a transceiving device adapted to transmit, by a first wireless communication method, a communication function restriction request to a wireless communication terminal and to receive a response to the communication function restriction request from the wireless communication terminal;

a gate device adapted to permit an entrance/exit of a person when the transmitting of the communication function restriction request and the receiving of the response by said transceiving device is complete; and

a notification device adapted to notify the server apparatus of an indication that the wireless communication terminal from which the response was received by said transceiving device exists in a predetermined area; and

the server apparatus comprises:

a management device adapted to manage an existence location of the wireless communication terminal in accordance with a notice supplied from said notification device.

25. (Previously Presented) A system according to claim 24, wherein said management device notifies the existence location of the wireless communication terminal to a second server apparatus owned by a carrier providing wireless communication for the wireless communication terminal.

26. (Previously Presented) A system according to claim 24, wherein said management device also manages an entering/leaving time of the wireless communication terminal relative to the predetermined area.

27. (Previously Presented) An entrance/exit management apparatus for regulating an entrance/exit of a person, comprising:

a transceiving device adapted to transmit, by a first wireless communication method, a communication function restriction request to a wireless communication terminal and to receive a response to the communication function restriction request from the wireless communication terminal; and

a gate device adapted to permit an entrance/exit of a person when the transmitting of the communication function restriction request and the receiving of the response by said transceiving device is complete.

28. (Previously Presented) An entrance/exit management apparatus according to claim 27, wherein said gate device regulates an entrance/exit of a person by opening/closing of a gate.

29. (Previously Presented) An entrance/exit management apparatus according to claim 27, wherein the communication function restriction request is used for selecting one of a non-restriction mode without communication restriction, a manner mode of automatically turning off incoming call sounds of real time communication, a drive mode of automatically responding to real time communication, a real time communication inhibition mode of permitting only non-real time communication, a call in/out restriction mode of inhibiting call in/out of all communications, and a wireless signal transmission restriction mode of inhibiting transmission of a wireless communication signal.

30. (Previously Presented) An entrance/exit management apparatus according to claim 27,  
wherein the response contains information indicating a communication function by the second wireless communication method after the communication function restriction request is received.

31. (Previously Presented) An entrance/exit management apparatus according to claim 27, further comprising a notification device adapted to notify a server apparatus of an entering/leaving state of the wireless communication terminal relative to a predetermined area.

32. (Previously Presented) An entrance/exit management apparatus according to claim 27, further comprising a notification device adapted to notify a server

apparatus of an entering/leaving time of the wireless communication terminal relative to a predetermined area.

33. (Previously Presented) An entrance/exit management apparatus according to claim 27, wherein said transceiving device transmits an indication signal for releasing the restriction of communication by the second wireless communication method when the wireless communication terminal exits from a predetermined area.

34. (Cancelled).

35. (Cancelled).

36. (Previously Presented) A wireless communication terminal comprising:  
a first communication device adapted to communicate with an entrance/exit management apparatus for regulating an entrance/exit of a person by a first wireless communication method;

a second communication device adapted to communicate by a second wireless communication method; and

a restriction device adapted to restrict communication of said second communication device in accordance with a communication function restriction request received by said first communication device from the entrance/exit management apparatus which regulates the entrance/exit of the person.

37. (Previously Presented) A wireless communication terminal according to claim 36, further comprising a transmission device adapted to transmit information on the communication restriction as a response to the communication function restriction request, and wherein the entrance/exit management apparatus regulates an entrance/exit of a person in accordance with contents of the response.

38. (Previously Presented) A wireless communication terminal according to claim 36, wherein said second communication device can switch among a plurality of communication restriction modes, and said restriction device changes the communication restriction mode of said second communication device in accordance with a mode designated by the entrance/exit management apparatus.

39. (Previously Presented) A wireless communication terminal according to claim 38, wherein when a person enters a predetermined area, if communication restriction of the mode designated by the entrance/exit management apparatus is more severe than communication restriction of a mode preset to said second communication mode, said restriction device changes a mode of said second communication device to the designated mode, whereas if not more severe, the mode is not changed.

40. (Previously Presented) A wireless communication terminal according to claim 38, wherein the communication restriction modes include at least one of a non-restriction mode without communication restriction, a manner mode of automatically turning off incoming call sounds of real time communication, a drive mode of

automatically responding to real time communication, a real time communication inhibition mode of permitting only non-real time communication, a call in/out restriction mode of inhibiting call in/out of all communications and a wireless signal transmission restriction mode of inhibiting transmission of a wireless communication signal.

41. (Currently Amended) A control method for a system having an entrance/exit management apparatus for regulating an entrance/exit of a person and a wireless communication terminal for communicating with the entrance/exit management apparatus, wherein:

the entrance/exit management apparatus executes:

a transceiving step of transmitting, by a first wireless communication method, a communication function restriction request to the wireless communication terminal and of receiving a response to the communication function restriction request; and

a permitting step of permitting an entrance/exit of a person when the transmitting of the communication function restriction request and the receiving of the response in said transceiving step is completed; and

the wireless communication terminal has a second communication device adapted to communicate by [[the]] a second wireless communication method, and the wireless communication terminal executes:

a communication step of communicating, via a first communication device, with the entrance/exit management apparatus by the first wireless communication method; and

a restricting step of restricting communication of the second communication device in accordance with the communication function restriction request received in said transceiving step by the first wireless communication method.

42. (Previously Presented) A control method for a system having an entrance/exit management apparatus for regulating an entrance/exit of a person and having a server apparatus for managing an entrance/exit of a person, wherein:

the entrance/exit management apparatus executes:

a transceiving step of transmitting, by a first wireless communication method, a communication function restriction request to a wireless communication terminal and of receiving a response to the communication function restriction request;

a permitting step of permitting an entrance/exit of a person when the transmitting of the communication function restriction request and the receiving of the response in said transceiving step is complete; and

a notification step of notifying the server apparatus of an indication that the wireless communication terminal from which the response was received in said transceiving step exists in a predetermined area; and

the server apparatus executes:

a management step of managing an existence location of the wireless communication terminal in accordance with a notice supplied by said notification step.

43. (Previously Presented) A control method for an entrance/exit management apparatus for regulating an entrance/exit of a person, comprising:

a transceiving step of transmitting a communication function restriction request to a wireless communication terminal by a first wireless communication method, and of receiving a response to the communication function restriction request, from the wireless communication terminal; and

a permitting step of permitting an entrance/exit of a person when the transmitting of the communication function restriction request and the receiving of the response in said transceiving step is complete.

44. (Cancelled).
